## INTRODUCTION AND BACKGROUND

The City of Encinitas is proposing to install street improvements, new inlets, and storm drain infrastructure underneath Coast Highway 101. The entirety of the project will span from A street to La Costa Avenue. The project will be divided into phases that are detailed in Appendix G. This report will provide hydrologic and hydraulic analysis for Phase 1B: roadway improvements from Marcheta to Basil Street, Phase 1C: storm drain improvements from 'A' Street to Marcheta Street (Hydrologic analysis only), and Phase 1E: El Portal Storm Drain Extension.

The El Portal North County Transit District pedestrian undercrossing that is to be constructed by T.Y. Lin is incorporated into this study. Flow from the undercrossing is pumped into a biofiltration basin which outlets into Michael Baker's proposed storm drain. This flow is accounted for in the hydraulic calculations presented in this report.

A FEMA Federal Insurance Rate Map is included in Appendix A. The FIRM map details the project limits in proximity to Special Flood Hazard Areas subject to inundation by the 1% annual chance flood.

The proposed storm drain mains and laterals in Phases 1C & 1E will convey runoff to existing storm drain systems that will discharge to Moonlight beach.

18/20/20 10:11 PM DATA: 10/20/20; User: Herb C...; File: C:\Users\Herb C...; Project: 18/20/20; Map: 18/20/20; Scale: 1:5000; Date: 10/20/20

FIGURE 1: PROJECT VICINITY MAP

## SCOPE OF ANALYSIS

The scope of this report includes:

1. Determination of the 50- and 100-year storm peak flow rates for Phases 1C & 1E. The 50-year peak flow rate was developed to analyze the affects of a lower than standards storm through the proposed drainage infrastructure.
2. Determination of street hydraulic characteristics as a result of proposed infrastructure,
3. Determination of inlet and pipe hydraulic characteristics as a result of proposed infrastructure.

The hydrologic and hydraulic analyses derived within this report are intentionally limited to the newly proposed storm drain inlets and associated laterals that ultimately discharging to Moonlight beach. Separate reports for proposed improvements related to other phases of the project will be provided at a later date.

Refer to Modeling Approach section below for further discussion.

## METHODOLOGY

### HYDROLOGY

Project flow rates have been determined using the “Rational Method” as specified within the Section 3 of the County of San Diego Hydrology Manual (June 2003) for watersheds of less than 0.5 square mile. Rational method flow rates and their associated time of concentration were conflued and routed through the storm drain using AES – Hydrowin 2013 (Advanced Engineering Solutions) to produce a total peak flow rate at each node in the system.

$$Q = C I A$$

**Equation 1 : Rational Method**

Where,

Q = Peak Discharge, (cubic feet per second)

C = Runoff Coefficient, (unit-less)

I = Average Rainfall Intensity, (inches per hour)

A = Drainage Area, (acres)

### Drainage Area (A)

The drainage areas for each storm drain system analyzed in this report were developed using two-foot topography obtained from the San Diego Geographic Information Source (SanGIS). Aerial imaging, Google Earth Street View, and field verification (MBI 3-26-2020 and 4-10-2020) were used in conjunction with the

topography to develop drainage areas. Refer to the Hydrologic Work Map, found in Appendix C of this report, for a graphical representation of the project drainage areas.

### Precipitation Loss/Runoff Coefficient (C)

Runoff coefficients were determined from Table 3-1 found in the County of San Diego Hydrology Manual (Hydrology Manual). Aerial photography and the hydrologic soil type were used to determine the appropriate land use classification detailed in table 3-1 of the San Diego County Hydrology Manual. A General Commercial land use designation is applied to drainage areas west of the 101 and the corresponding runoff coefficient from table 3-1 is used. Drainage areas east of the 101 are roughly 65% impervious and the corresponding 24.0 DU/A or less runoff coefficient from table 3-1 is applied.

Land use information from aerial photography was used to determine the number of dwelling units per acre and correlated with the hydrologic soil type. The City of Encinitas' Engineering Manual assumes type D soil for all areas per Section 6.202. A summary of these runoff coefficients can be found in Appendix C.

### Time of Concentration ( $T_c$ )

The time of concentration ( $T_c$ ) is the sum of the initial time ( $T_i$ ) and travel time ( $T_t$ ), as identified in section 3 of the Hydrology Manual. The initial time of concentration is based on Table 3-2 of the Hydrology Manual.

$T_t$  is computed by dividing the gutter or street flow path in a particular drainage subarea by the computed flow velocity for the segment in question. Flow velocity is conservatively based on a 0.5-foot depth (full gutter flow) condition in Figure 3-6 of the Hydrology Manual. A minimum  $T_c$  of 5 minutes was used per the Hydrology Manual. Calculations can be found in Appendix C.

### Rainfall Intensity (I)

This study considers the 50 and 100-year storm intensities based upon Figure 3-2 and the Isopluvial maps found in Appendix B of the hydrology manual.

## HYDRAULICS

Hydraulic analyses for each new inlet and storm drain lateral have been performed using Hydraflow Storm Sewers. Gutter, inlet, and pipe hydraulics have been developed and analyzed internally within the Hydraflow model. Flow rates have been manually input into the program at each inlet for 50-year and 100-year analyses. Street flow and spread lengths will allow a travel lane for emergency vehicles.

## Gutter Hydraulics

Hydraflow uses trial and error with a modification of Manning's Equation to determine depth and spread of gutter flow.

$$D = \left( \frac{Q * n}{K_C * Z * \sqrt{S}} \right)^{0.375}$$

**Equation 2 : Gutter Spread**

Where,

D = Depth of flow in gutter, (ft)

Q = Flow in gutter, (cfs)

Kc = 0.56 (empirically derived)

n = Manning's roughness coefficient

Z = Reciprocal of the cross slope

S = Longitudinal gutter slope

## Inlet Hydraulics

Inlet sizing calculations for sump and on grade inlets have been performed in accordance with the San Diego Hydrology Manual. Hydraflow storm sewers is used to calculate gutter spread. On-grade inlets will collect 100% of the Q50 and Q100 with no bypass. Proposed inlets are located at low points or points along the roadway profile where cross/longitudinal slope is changing.

$$Q = C_o * h * L * (2gd)^{1/2}$$

**Equation 3 : Curb Inlets in Sump When Operating as an Orifice**

Where,

Q = inlet capacity, (CFS)

Co = 0.67 (empirically derived coefficient).

h= throat height of curb opening (ft.)

L = length of curb opening, (ft.)

g = 32.2 (gravitational constant)

d = Flow depth at face of curb, (0.5 ft.)

$$\frac{Q}{L_T} = 0.7 * (a + y)^{3/2}$$

Equation 4 : Curb Inlets on Grade

Where,

Q = inlet capacity, (CFS)

L<sub>T</sub> = length of clear opening of inlet for total interception (ft)

a = depth of depression of curb at inlet (0.33 ft)

y= depth of flow approaching the curb inlet (ft.)

### Pipe Hydraulics

Pipe hydraulic calculations have been determined within Hydraflow Storm Sewers and are based upon the Standard Step Method. This method uses a combination of Bernoulli’s energy equation and Manning’s equation, in an iterative process between upstream and downstream ends, to determine hydraulic profiles. The method includes head losses due to friction and other minor losses, based on user defined loss coefficients found within the County Hydraulic Manual 2014.

$$\frac{V_1^2}{2 * g} + Z_1 + Y_1 = \frac{V_2^2}{2 * g} + Z_2 + Y_2 + HL$$

Equation 5 : Bernoulli's Equation

Where,

V = Velocity, (FPS)

g = gravitational acceleration constant, in (ft/s<sup>2</sup>)

Z = Invert elevation, (ft)

Y = Difference between the hydraulic grade line and invert elevation, (ft)

HL = Head losses, (ft)

## Modeling Approach

Proposed laterals and inlets have been modeled in Hydraflow Storm Sewers to determine the hydraulic grade line (HGL) under post-development 50- and 100-year conditions. The improvements detailed in T.Y. Lin's study "El Portal Bicycle/Pedestrian Undercrossing Final Drainage Report" are incorporated into the hydraulic model.

A biofiltration basin that was designed by T.Y. Lin is located immediately south of the proposed El Portal roundabout. This basin will be connected to the Phase 1E storm drain per this plan set. T.Y. Lin's undercrossing will pump approximately 0.9 cfs into the southerly biofiltration basin. This additional flow is incorporated into the Hydraulic model. The lateral storm drains that connect to the biofiltration basin and the El Portal roundabout curb inlet are flat with a slope that is less than 0.50%.

## RESULTS

### Inlet Hydraulics

Appendix D summarizes the sump and on grade inlet calculations that are in accordance with standards detailed by the San Diego County Hydrology Manual. Refer to Appendix D for complete output reports generated by Hydraflow Storm Sewers. All proposed inlets in-sag are sized to capture the entire 100-YR flow rate with ponding limited to 6" or less. Proposed on-grade inlets have been designed to capture 100% of the 100-year peak flow rate with no bypass flow.

### Storm Drain Main and Lateral Hydraulics

The HGLs for all storm drain systems are beneath the finished surface for the peak 50-year flow rate.

The HGLs for the storm drain improvements from A street to Marcheta street is beneath the finished surface for the 100-year peak flow rate.

The HGL for the El Portal storm drain extension is out of the ground along the upstream extent of the proposed pipe during the 100-year peak flow rate. This occurs because the storm drain reach that connects to the El Portal intersection and existing sump has a slope that is less than 0.5% and the pipe is bucking grade.

The Hydraflow Storm Sewers Modeling results and corresponding storm drain main/lateral profiles are presented in Appendices E and F.

## CONCLUSION

The 50- and 100-year project site peak flow rates have been developed for each proposed inlet using the Rational Method. This approach is consistent with local methodology and appropriate given the relatively small tributary drainage areas.

Proposed inlets and storm drain laterals have been hydraulically analyzed using project site peak flow rates to determine spread width, capture capacity, and hydraulic grade line within the laterals. In all cases, spread width for the 100-year event is under 20 feet, which meets the criteria of Section 2.2.1. of the County's Drainage Design Manual. In all cases, newly proposed on-grade inlets capture 100% of the 100-year approach flow.

The storm drain system from A Street to Marcheta Street has been designed to convey the 50- and 100-year peak flow rate while maintaining an HGL that is under the finished surface. This storm drain system will be constructed with the Streetscape Improvements from 'A' Street to Marcheta Street at a later date.

The El Portal storm drain extension system will be able to convey the 50-year peak flow rate while maintaining the HGL under the finished surface. The 100-year peak flow rate HGL is completely under the finished surface except for the upstream portion of the pipe that connects to the El Portal intersection and existing localized sump. This localized low point along the El Portal intersection is going to remain the same as in the existing condition but the benefit provided by this project is that proposed storm drain system will be able to convey this existing flooding to the Moonlight Beach outfall.

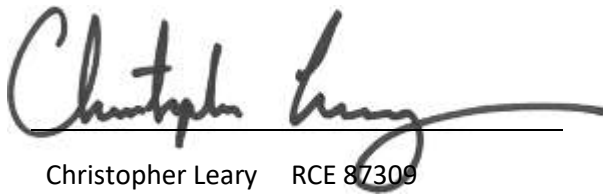

Newly proposed storm drain infrastructure improvements will reduce flooding along North Coast Highway 101 for all storm events, as compared to pre-development conditions. The most benefit will be realized during smaller, more frequent storm events.

## DECLARATION OF RESPONSIBLE CHARGES

I, hereby declare that I am the Civil Engineer of work for this project, that I have exercised responsible charge over the design of the project as defined in Section 6703 of the Business and Professions Code, and that the design is consistent with current design.

I understand that the check of project drawings and specifications by the County of San Diego is confined to a review only and does not relieve me, as Engineer of Work, of my responsibilities for the project design.

## Appendix A – FEMA Documents

Included within this appendix:  
FEMA FIRM Panels

**Michael Baker**  
INTERNATIONAL

FEMA FIRMS

MAP SCALE 1" = 1000'

**LEGEND**

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

- ZONE A No Base Flood Elevations determined.
- ZONE AE Base Flood Elevations determined.
- ZONE AH Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
- ZONE AO Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
- ZONE AR Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
- ZONE A99 Areas to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no Base Flood Elevations determined.
- ZONE V Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
- ZONE VE Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X Areas determined to be outside the 0.2% annual chance floodplain.

ZONE D Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

This is an official copy of a portion of the above referenced flood map. It was extracted using F-MIT On-Line. This map does not reflect changes or amendments which may have been made subsequent to the date on the title block. For the latest product information about National Flood Insurance Program flood maps check the FEMA Flood Map Store at [www.msc.fema.gov](http://www.msc.fema.gov)

**Directions for Application:**

- (1) From precipitation maps determine 6 hr and 24 hr amounts for the selected frequency. These maps are included in the County Hydrology Manual (10, 50, and 100 yr maps included in the Design and Procedure Manual).
- (2) Adjust 6 hr precipitation (if necessary) so that it is within the range of 45% to 65% of the 24 hr precipitation (not applicable to Desert).
- (3) Plot 6 hr precipitation on the right side of the chart.
- (4) Draw a line through the point parallel to the plotted lines.
- (5) This line is the intensity-duration curve for the location being analyzed.

**Application Form:**

- (a) Selected frequency 50 year
- (b)  $P_6 = 2.2$  in.,  $P_{24} = 3.75$ ,  $\frac{P_6}{P_{24}} = 59$  %<sup>(2)</sup>
- (c) Adjusted  $P_6^{(2)} = 2.2$  in.
- (d)  $t_x =$  \_\_\_\_\_ min.
- (e)  $I =$  \_\_\_\_\_ in./hr.

Note: This chart replaces the Intensity-Duration-Frequency curves used since 1965.

Note that the Initial Time of Concentration should be reflective of the general land-use at the upstream end of a drainage basin. A single lot with an area of two or less acres does not have a significant effect where the drainage basin area is 20 to 600 acres.

Table 3-2 provides limits of the length (Maximum Length ( $L_M$ )) of sheet flow to be used in hydrology studies. Initial  $T_i$  values based on average C values for the Land Use Element are also included. These values can be used in planning and design applications as described below. Exceptions may be approved by the “Regulating Agency” when submitted with a detailed study.

**Table 3-2**

**MAXIMUM OVERLAND FLOW LENGTH ( $L_M$ )  
 & INITIAL TIME OF CONCENTRATION ( $T_i$ )**

Element*	DU/ Acre	.5%		1%		2%		3%		5%		10%

ON-GRADE								
ON-GRADE								
ON-GRADE								
ON-GRADE								

1. Taken from Improvement Plan
2. From hydrology calculations
3. Per section 2.3.1 of the San Diego County Hydrology Manual
4. From Equation:  $Q = 0.7L(a+y)^{3/2}$
5. Length shown on plans (Required Length of Opening + 1 foot)
6. Gutter Spread calculated in storm sewers (20' max per 2.2.1 of SDCHDM)

## Curb Inlet Sizing

### SUMP INLETS

Type of Inlet	Inlet Location/Map ID	Surface Flow <sup>1</sup> Q 50 (cfs)	Required Length of Opening <sup>2</sup> (ft)	Use 3 Length <sup>3</sup> (ft.)	50-yr Gutter Spread <sup>4</sup>
SUMP	Encinitas 54	4.4	2.4	5	18.35
SUMP	Encintias 56	0.7	0.4	5	5.38
SUMP	Encinitas 57	0.3	0.2	5	3.06
SUMP	Encinitas 58	1.8	1.0	5	10.11
SUMP	Encinitas 60	3.0	1.7	5	14.21
SUMP	Encinitas 62	2.2	1.2	5	9.15

1. From hydrology calculations
2. From The Orifice Equation:  $Q = C \cdot A \cdot (2 \cdot g \cdot H)^{1/2}$   
 The Orifice Coefficient,  $C = 0.6$ , and Gravitational Constant,  $g = 32.2 \text{ ft/s}^2$ , and AREA,  $A = L \cdot h$   
 The Inlet Opening Height,  $h = 0.5 \text{ ft}$ , Per SDRSD D-2  
 The Head Measured from the Centroid of Orifice,  $H = 10''$  (Ponded to TC)-3'' (centroid) = 0.58 ft  
 $\therefore Q = .6 \cdot L \cdot 0.5 \cdot (2 \cdot 32.2 \cdot 0.58)^{1/2}$ , Therefore  $L = Q / 1.8$
3. Length shown on plans (Required Length of Opening + 1 foot)
4. Gutter Spread calculated in storm sewers (20' max per 2.2.1 of SDCHDM)

ON-GRADE								
ON-GRADE								
ON-GRADE								
ON-GRADE								
ON-GRADE								
ON-GRADE								

1. Taken from Improvement Plan
2. From hydrology calculations
3. Per section 2.3.1 of the San Diego County Hydrology Manual
4. From Equation:  $Q = 0.7L(a+y)^{3/2}$
5. Length shown on plans (Required Length of Opening + 1 foot)
6. Gutter Spread calculated in storm sewers (20' max per 2.2.1 of SDCHDM)

## Curb Inlet Sizing

### SUMP INLETS

Type of Inlet	Inlet Location/Map ID	Surface Flow <sup>1</sup> Q 100 (cfs)	Required Length of Opening <sup>2</sup> (ft)	Use 3 Length <sup>3</sup> (ft.)	100-yr Gutter Spread <sup>4</sup>
SUMP	Encinitas 54	5.0	2.8	5	19.98
SUMP	Encintias 56	0.8	0.4	5	5.90
SUMP	Encinitas 57	0.4	0.2	5	3.71
SUMP	Encinitas 58	2.1	1.2	5	11.20
SUMP	Encinitas 60	3.4	1.9	5	15.50
SUMP	Encinitas 62	2.5	1.4	5	9.15

1. From hydrology calculations
2. From The Orifice Equation:  $Q = C \cdot A (2 \cdot g \cdot H)^{1/2}$   
 The Orifice Coefficient,  $C = 0.6$ , and Gravitational Constant,  $g = 32.2 \text{ ft/s}^2$ , and AREA,  $A = L \cdot h$   
 The Inlet Opening Height,  $h = 0.5 \text{ ft}$ , Per SDRSD D-2  
 The Head Measured from the Centroid of Orifice,  $H = 10''$  (Ponded to TC)-3'' (centroid) = 0.58 ft  
 $\therefore Q = .6 \cdot L \cdot 0.5 \cdot (2 \cdot 32.2 \cdot 0.58)^{1/2}$ , Therefore  $L = Q / 1.8$
3. Length shown on plans (Required Length of Opening + 1 foot)
4. Gutter Spread calculated in storm sewers (20' max per 2.2.1 of SDCHDM)

Appendix H – Excerpts from T.Y. Lin’s El Portal Drainage Study

SCALE: 1" = 50'

SCALE: 1" = 200'

**LEGEND:**

- EXISTING FLOW
- PROPOSED FLOW
- PROPOSED STORM DRAIN
- PROPOSED RETAINING WALL

BASIN	AREA (AC)	T <sub>c</sub> (MIN)	RUNOFF COEF.	Q100 (CFS)
1A	4.14	27.4	0.46	3.03
1B	0.45	5	0.54	0.89
1C	1.56	5	0.50	2.86

FLOW FROM BASIN 1B IS PUMPED FROM THE EL PORTAL NCTS PEDESTRIAN UNDERCROSSING INTO THE SOUTHERLY BASIN. THIS FLOW ENTERS THE MBI PHASE 1E STORM DRAIN AND IS ACCOUNTED FOR IN ALL HYDRAULIC CALCULATIONS.

**EL PORTAL BICYCLE / PEDESTRIAN UNDERCROSSING PROPOSED DRAINAGE EXHIBIT**
